

Sudeb Mukherjee

Department of Cardiology, BM Birla Heart Hospital, Kolkata, India

48 year old gentleman with uncontrolled diabetics status with severe heart failure symptoms with LVEF of 25% presented with gangrene of right lower leg. He was on optimum medical management with guideline based medical treatment for last 3 months. On evaluation the amputation of the lower limb from ankle was formed and decided by the competent medical board. But it was advised to correct the CTO segment from above the knee to avoid delayed wound healing or any future progression of disease. PTA to right lower limb done with peripheral DCB and the results were excellent. He went home at 48 hours walking with support and lesser pain for first time in last 3 months.
